Dock Operations Memo

Left column first paragraph. The pilot programme moved 128,400 pallets across three regional hubs in the second quarter, a 12.5 percent increase over the same period last year. Average dock-to-stock time fell from 4.2 hours to 3.1 hours after the scheduling change, while the number of missed appointments dropped by 38 percent. Warehouse B remains the constraint: its inbound lane utilisation reached 94 percent during peak weeks.

Left column second paragraph explains exceptions in their inbound schedules.

Right column first paragraph. This lists the owners for each remediation action.

Right column second paragraph. Two risks need attention. First, the cold-chain corridor depends on a single carrier and any interruption would delay roughly 900 shipments per week. Second, the new scanning stations are running firmware 2.4.1, which has a known issue with duplicate labels. A remediation plan is due on 15 November 2026 and will be tracked weekly.
