# Dock Operations Memo

Left column first paragraph. The pilot ran from 1 March to 31 May and covered 128,400 pallets across three regional hubs in the second quarter, a 12.5 percent increase over the same period last year. Average dock-to-stock time fell from 4.2 hours to 3.1 hours after the scheduling change, while the number of missed appointments dropped by 38 percent. Warehouse B remains the constraint: its inbound lane utilisation reached 94 percent during peak weeks.

Left column second paragraph. The exceptions were concentrated on Tuesday mornings when two carriers arrived within the same thirty minute window. Site leads proposed staggering those arrivals by ten minutes, which would add no cost and could be implemented immediately.

Right column first paragraph. Two risks need attention. First, the cold-chain corridor depends on a single carrier and any interruption would delay roughly 900 shipments per week. Second, the new scanning stations are running firmware 2.4.1, which has a known issue with duplicate labels. A remediation plan is due on 15 November 2026 and will be tracked weekly.
